## 1.2 Description

ESP32-PICO-MINI-02 and ESP32-PICO-MINI-02U are two general-purpose Wi-Fi + Bluetooth + Bluetooth LE MCU modules. They are based on ESP32-PICO-V3-02, a System-in-Package (SiP) device, which integrates an 8 MB SPI flash, 2 MB SPI Pseudo static RAM (PSRAM) and 40 MHz crystal oscillator. The rich set of peripherals and a small size make the two modules an ideal choice for a wide variety of IoT applications, ranging from home automation, smart building, consumer electronics to industrial control, and they are suitable for intelligent speakers, speech recognition toys, intelligent gateway and Ethernet, etc.

ESP32-PICO-MINI-02 comes with a PCB antenna. ESP32-PICO-MINI-02U comes with a connector for an external antenna. The ordering information of the two modules is listed as follows:

**Table 1: Ordering Information**

Module	Ordering Code	Chip embedded	Module dimensions (mm)
ESP32-PICO-MINI-02	ESP32-PICO-MINI-02-N8R2	ESP32-PICO-V3-02	13.2 × 16.6 × 2.4
ESP32-PICO-MINI-02U	ESP32-PICO-MINI-02U-N8R2	ESP32-PICO-V3-02	13.2 × 11.2 × 2.4

At the core of ESP32-PICO-MINI-02 and ESP32-PICO-MINI-02U is the ESP32-PICO-V3-02 sip\*. The chip embedded is designed to be scalable and adaptive. There are two CPU cores that can be individually controlled, and the CPU clock frequency is adjustable from 80 MHz to 240 MHz. The chip also has a low-power coprocessor that can be used instead of the CPU to save power while performing tasks that do not require much computing power, such as monitoring of peripherals. This ESP32 chip integrates a rich set of peripherals, ranging from SD card interface, capacitive touch sensors, ADC, DAC, Two-Wire Automotive Interface, to Ethernet, high-speed SPI, UART, I2S, I2C, etc.

### 3.3 Strapping Pins

**Note:**

The content below is excerpted from Section Strapping Pins in [ESP32 Series Datasheet](#). For the strapping pin mapping between the chip and modules, please refer to Chapter 5 [Module Schematics](#).

ESP32 has five strapping pins:

- MTDI
- GPIO0
- GPIO2

- MTDO
- GPIO5

Software can read the values of these five bits from register "GPIO\_STRAPPING".

During the chip's system reset release (power-on-reset, RTC watchdog reset and brownout reset), the latches of the strapping pins sample the voltage level as strapping bits of "0" or "1", and hold these bits until the chip is powered down or shut down. The strapping bits configure the device's boot mode, the operating voltage of VDD\_SDIO and other initial system settings.

Each strapping pin is connected to its internal pull-up/pull-down during the chip reset. Consequently, if a strapping pin is unconnected or the connected external circuit is high-impedance, the internal weak pull-up/pull-down will determine the default input level of the strapping pins.

To change the strapping bit values, users can apply the external pull-down/pull-up resistances, or use the host MCU's GPIOs to control the voltage level of these pins when powering on ESP32.

After reset release, the strapping pins work as normal-function pins.

Refer to Table 3 for a detailed boot-mode configuration by strapping pins.

**Table 3: Strapping Pins**

Voltage of Internal LDO (VDD_SDIO)					
Pin	Default	3.3 V		1.8 V	
MTDI	Pull-down	0		1	
Bootling Mode					
Pin	Default	SPI Boot		Download Boot	
GPIO0	Pull-up	1		0	
GPIO2	Pull-down	Don't-care		0	
Enabling/Disabling Debugging Log Print over U0TXD During Bootling					
Pin	Default	U0TXD Active		U0TXD Silent	
MTDO	Pull-up	1		0	
Timing of SDIO Slave					
Pin	Default	FE Sampling FE Output	FE Sampling RE Output	RE Sampling FE Output	RE Sampling RE Output
MTDO	Pull-up	0	0	1	1
GPIO5	Pull-up	0	1	0	1

\* FE: falling-edge, RE: rising-edge

\* Firmware can configure register bits to change the settings of "Voltage of Internal LDO (VDD\_SDIO)" and "Timing of SDIO Slave", after bootling.

\* The module integrates a 3.3 V SPI flash, so the pin MTDI cannot be set to 1 when the module is powered up.

The illustration below shows the setup and hold times for the strapping pins before and after the CHIP\_PU signal goes high. Details about the parameters are listed in Table 4.

Figure 5: Setup and Hold Times for the Strapping Pins

Parameters	Description	Min.	Unit

## 4 Electrical Characteristics

### 4.1 Absolute Maximum Ratings

Stresses above those listed in *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

<sup>1</sup> Please see Appendix IO MUX of [ESP32 Series Datasheet](#) for IO's power domain. VDD is the I/O voltage for a particular power domain of pins.

<sup>2</sup> For VDD3P3\_CPU and VDD3P3\_RTC power domain, per-pin current sourced in the same domain is gradually reduced from around 40 mA to around 29 mA,  $V_{OH} \geq 2.64\text{ V}$ , as the number of current-source pins increases.

<sup>3</sup> Pins occupied by flash and/or PSRAM in the VDD\_SDIO power domain were excluded from the test.

## 4.4 Current Consumption Characteristics

Owing to the use of advanced power-management technologies, the module can switch between different power modes. For details on different power modes, please refer to Section *RTC and Low-Power Management* in [ESP32 Series Datasheet](#).

Table 8: Current Consumption Depending on RF Modes

Work mode	Description	Peak (mA)	
Active (RF working)	TX	802.11b, 20 MHz, 1 Mbps, @19.5 dBm	368
		802.11g, 20 MHz, 54 Mbps, @14 dBm	258
		802.11n, 20 MHz, MCS7, @13 dBm	248
		802.11n, 40 MHz, MCS7, @13 dBm	250
	RX <sup>2</sup>	802.11b/g/n, 20 MHz	111
		802.11n, 40 MHz	117

<sup>1</sup> The current consumption measurements are taken with a 3.3 V supply at 25 °C of ambient temperature at the RF port. All transmitters' measurements are based on a 100% duty cycle.

<sup>2</sup> The current consumption figures for in RX mode are for cases when the peripherals are disabled and the CPU idle.

**Table 9: Current Consumption Depending on Work Modes**

Work mode	Description		Current consumption (Typ)
Modem-sleep <sup>1, 2</sup>	The CPU is powered on <sup>3</sup>	240 MHz	30 ~ 68 mA
		160 MHz	27 ~ 44 mA
		Normal speed: 80 MHz	20 ~ 31 mA
Light-sleep	—		0.8 mA
Deep-sleep	The ULP coprocessor is powered up <sup>4</sup>		150 $\mu$ A
	ULP sensor-monitored pattern <sup>5</sup>		100 $\mu$ A @1% duty
	RTC timer + RTC memory		10 $\mu$ A
	RTC timer only		5 $\mu$ A
Power off	CHIP_PU is set to low level, the chip is powered down		1 $\mu$ A

<sup>1</sup> The current consumption figures in Modem-sleep mode are for cases where the CPU is powered up and the cache idle.

<sup>2</sup> When Wi-Fi is enabled, the chip switches between Active and Modem-sleep modes. Therefore, current consumption changes accordingly.

<sup>3</sup> In Modem-sleep mode, the CPU frequency changes automatically. The frequency depends on the CPU load and the peripherals used.

<sup>4</sup> During Deep-sleep, when the ULP coprocessor is powered up, peripherals such as GPIO and RTC I2C are able to operate.

<sup>5</sup> The "ULP sensor-monitored pattern" refers to the mode where the ULP coprocessor or the sensor works periodically. When ADC works with a duty cycle of 1%, the typical current consumption is 100  $\mu$ A.

# 5 Module Schematics

This is the reference design of the module.

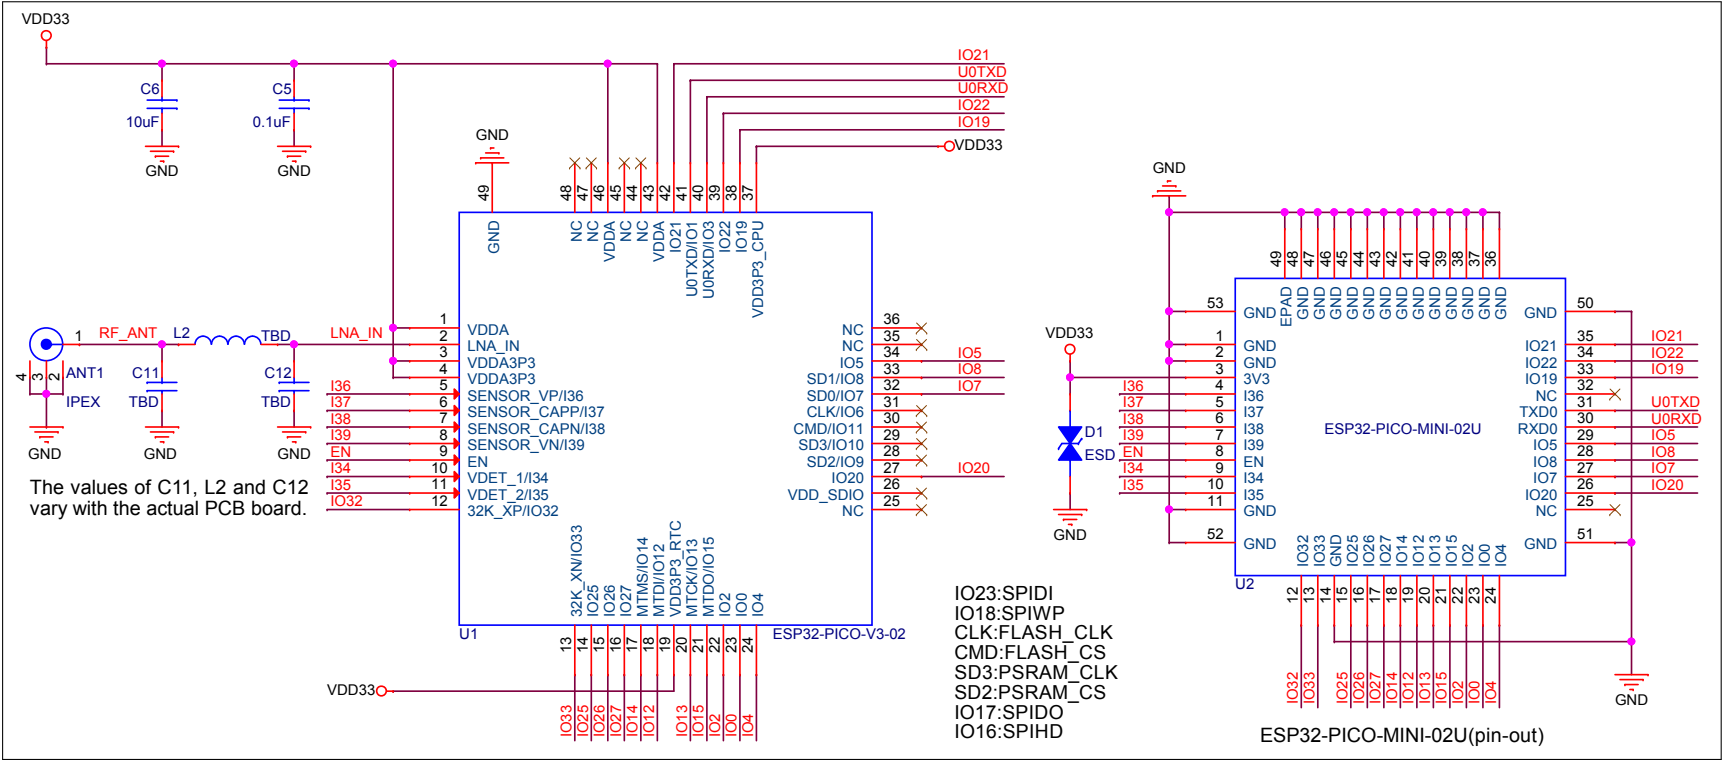

Figure 7: ESP32-PICO-MINI-02U Schematics

## 6 Peripheral Schematics

This is the typical application circuit of the module connected with peripheral components (for example, power supply, antenna, reset button, JTAG interface, and UART interface).

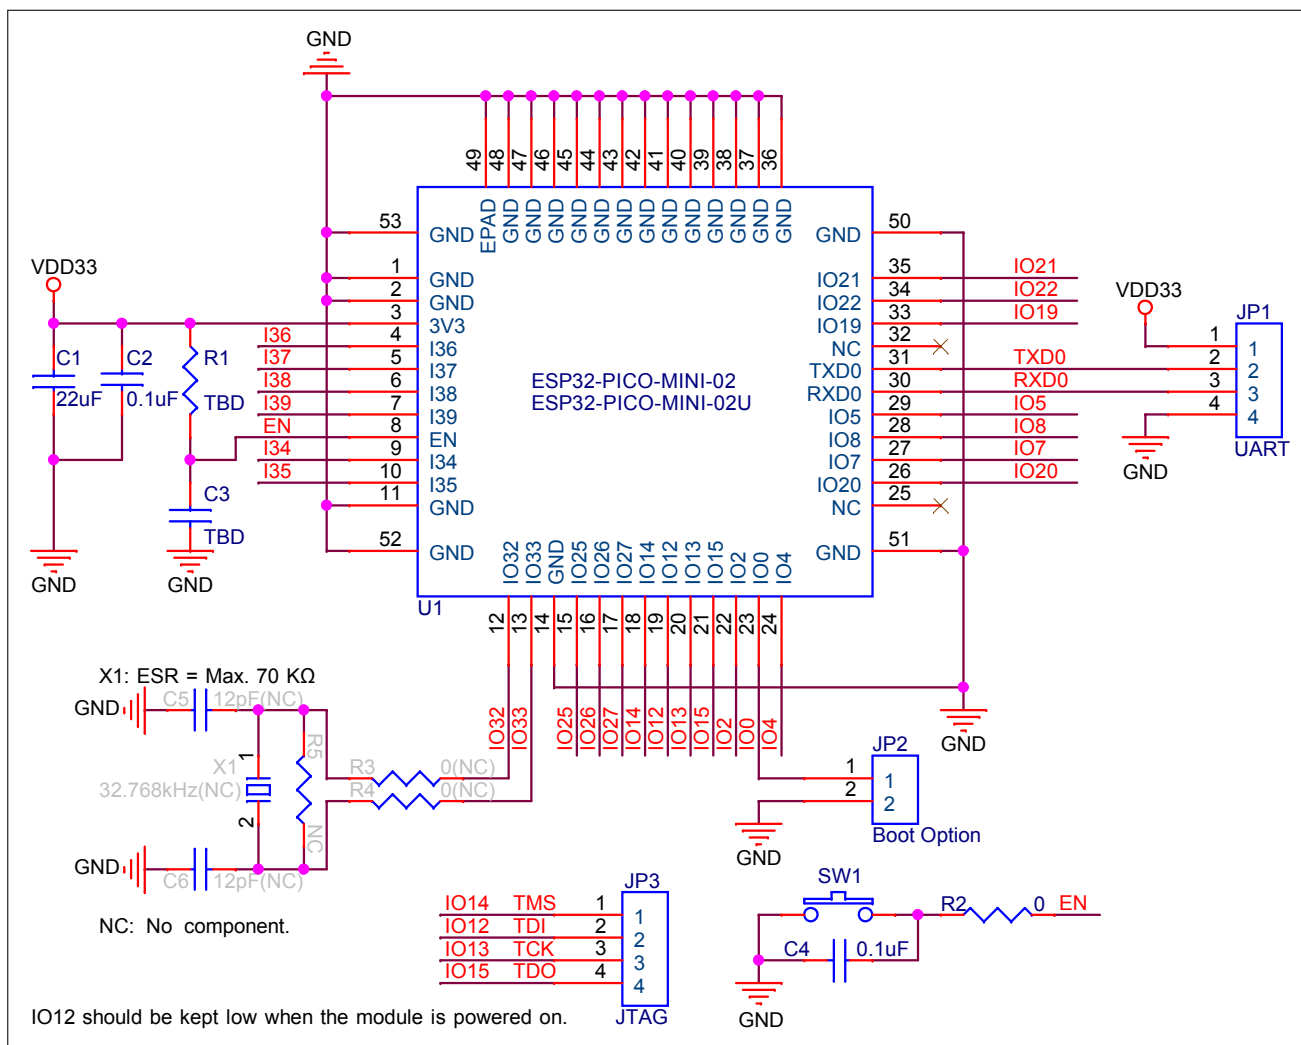

Figure 8: Peripheral Schematics

- Soldering EPAD Pin 49 to the ground of the base board is not a must. If you choose to solder it, please apply the correct amount of soldering paste. Too much soldering paste may increase the gap between the module and the baseboard. As a result, the adhesion between other pins and the baseboard may be poor.
- To ensure that the power supply to the ESP32 chip is stable during power-up, it is advised to add an RC delay circuit at the EN pin. The recommended setting for the RC delay circuit is usually  $R = 10\text{ k}\Omega$  and  $C = 1\ \mu\text{F}$ . However, specific parameters should be adjusted based on the power-up timing of the module and the power-up and reset sequence timing of the chip. For ESP32's power-up and reset sequence timing diagram, please refer to Section *Power Scheme* in [ESP32 Series Datasheet](#).

## 8 Product Handling

### 8.1 Storage Conditions

The products sealed in moisture barrier bags (MBB) should be stored in a non-condensing atmospheric environment of  $< 40\text{ }^{\circ}\text{C}$  and 90%RH. The module is rated at the moisture sensitivity level (MSL) of 3.

After unpacking, the module must be soldered within 168 hours with the factory conditions  $25 \pm 5\text{ }^{\circ}\text{C}$  and 60 %RH. If the above conditions are not met, the module needs to be baked.

### 8.2 Electrostatic Discharge (ESD)

- Human body model (HBM):  $\pm 2000\text{ V}$
- Charged-device model (CDM):  $\pm 500\text{ V}$

### 8.3 Reflow Profile

Solder the module in a single reflow.

Figure 14: Reflow Profile

## 8.4 Ultrasonic Vibration

Avoid exposing Espressif modules to vibration from ultrasonic equipment, such as ultrasonic welders or ultrasonic cleaners. This vibration may induce resonance in the in-module crystal and lead to its malfunction or even failure. As a consequence, **the module may stop working or its performance may deteriorate.**
